

List of data structures

Data types

Primitive types

- Boolean, true or false.
- Character
- Floating-point numbers, limited precision approximations of real number values.
 - Including Single precision and Double precision IEEE 754 Floats, among others
- Fixed-point numbers
- Integer, integral or fixed-precision values.
- Reference (also called a pointer or handle), a small value referring to another object's address in memory, possibly a much larger one.
- Enumerated type, a small set of uniquely named values.
- Date Time, value referring to Date and Time

Composite types or non-primitive type

- Array (as an example String which is an array of characters)
- Record (also called Associative array, Map, or structure)
- Union (Tagged union is a subset, also called variant, variant record, discriminated union, or disjoint union)

Abstract data types

- Container
- List
- Tuple
- Multimap
- Set
- Multiset (bag)
- Stack
- Queue (example Priority queue)
- Double-ended queue
- Graph (example Tree, Heap)

Some properties of abstract data types:

Structure	Order	Unique
List	yes	No
Associative array	no	yes
Set	no	yes
Stack	yes	No
Multimap	no	No
Multiset (bag)	no	No
Queue	yes	No

Order means the insertion sequence counts.

Unique means that duplicate elements are not allowed, based on some inbuilt or, alternatively, user-defined rule for comparing elements.

A data structure is said to be linear if its elements form a sequence.
